Meio Corte

Em peças simétricas é conveniente fazer com que o plano de corte vá somente até a metade da peça.

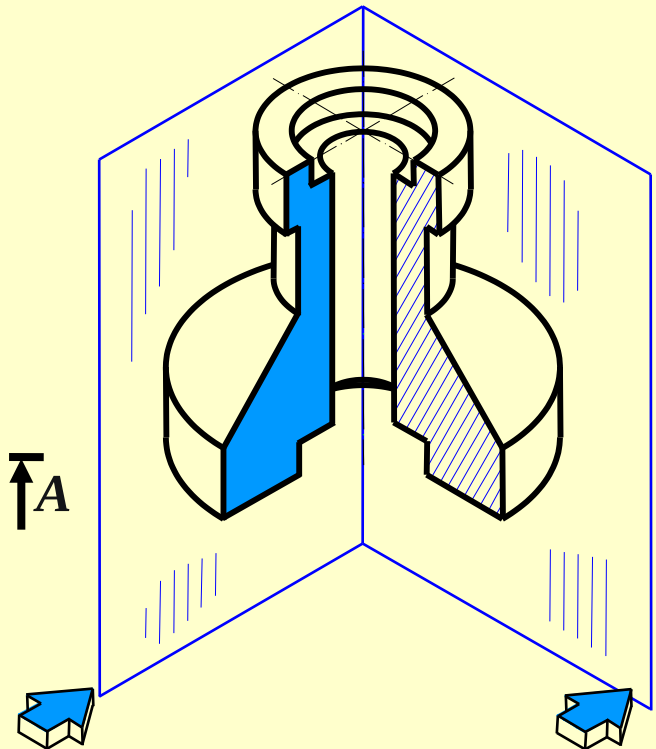

A vista em corte representará simultaneamente a forma externa e interna da peça.

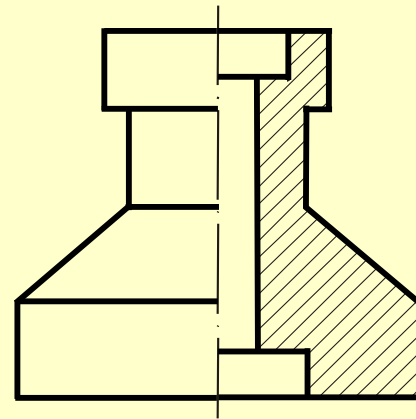

A linha de corte vai até o meio da peça e desvia perpendicularmente para fora da peça.

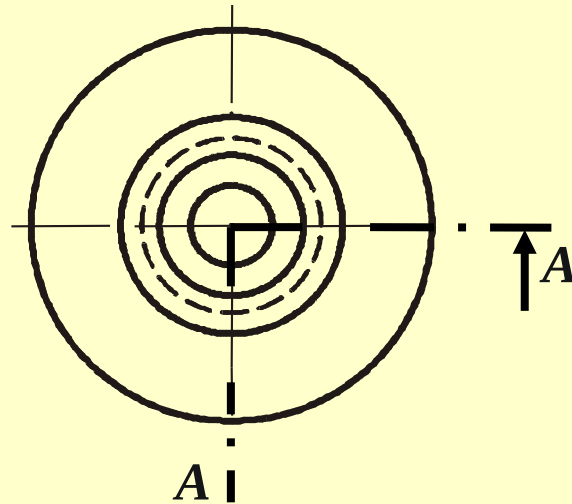

A PRÓPRIA LINHA DE CENTRO SEPARA A PARTE CORTADA DA NÃO CORTADA

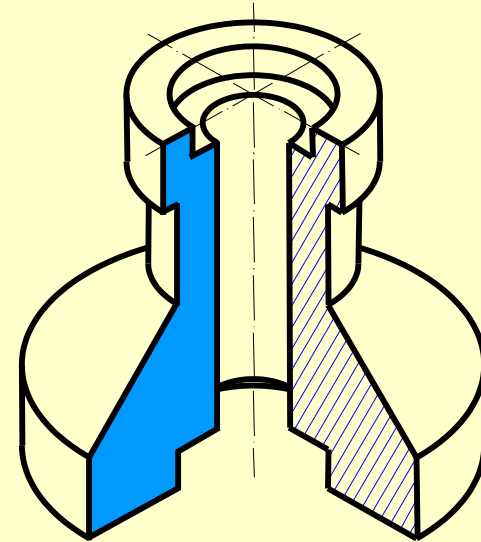

Meio Corte

Corte - AA

**APLICADO SOMENTE
EM PEÇAS SIMÉTRICAS**

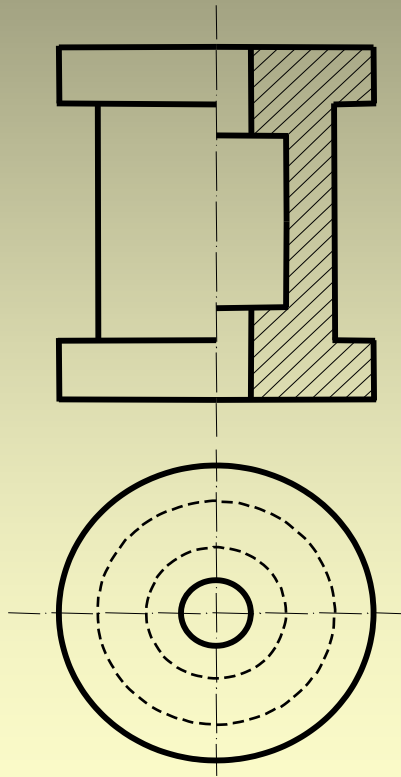

Assim como no corte total, no meio corte, tanto na parte cortada como na parte não cortada, também não se deve representar as arestas invisíveis.

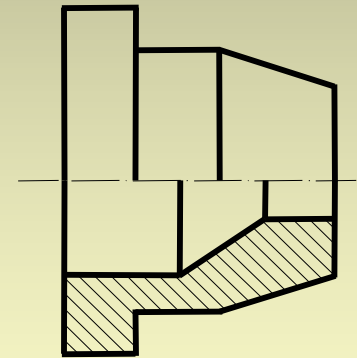

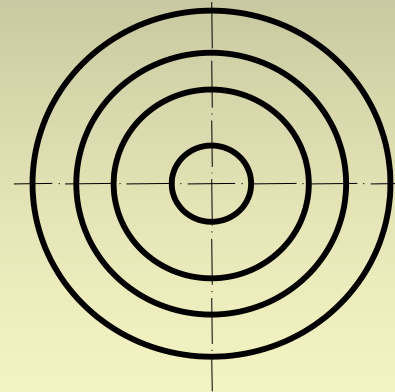

Como o meio corte só deve ser aplicado em peças simétricas, na maioria dos casos a linha de corte não será indicada porque sua posição é óbvia.

QUANDO NÃO HÁ REPRESENTAÇÃO DA LINHA DE CORTE

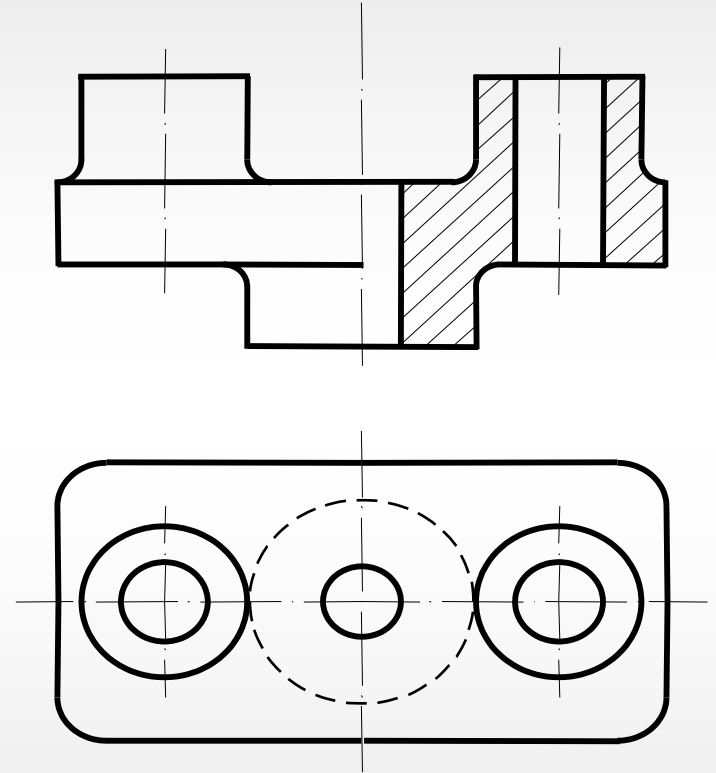

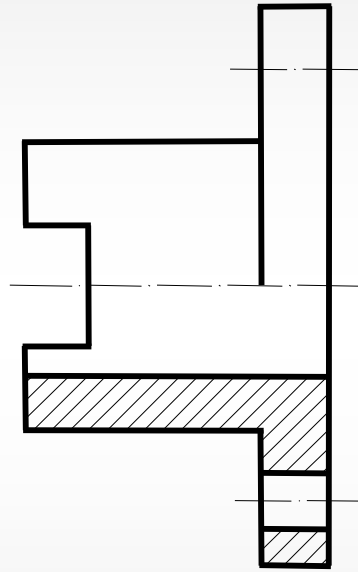

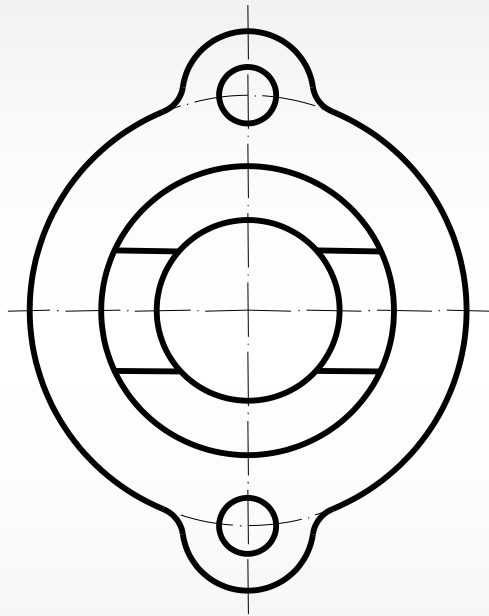

Se o eixo de simetria for vertical, a metade cortada deverá ser representada à direita.

Se o eixo de simetria for horizontal, a metade cortada deverá estar na parte inferior do desenho.

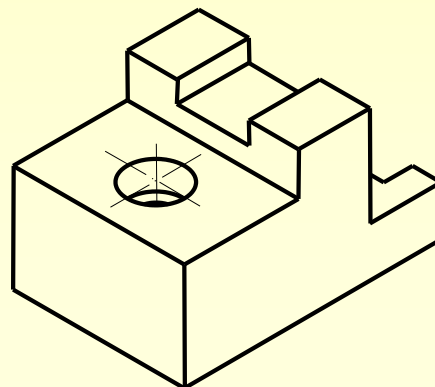

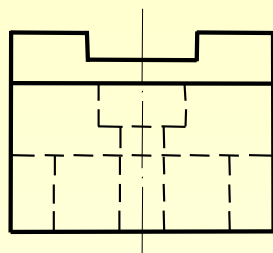

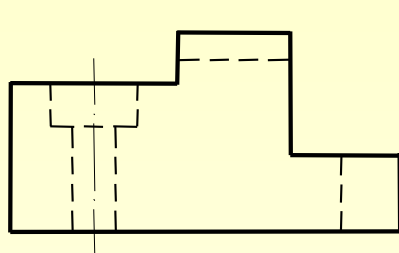

Meio Corte – Exercícios Resolvidos

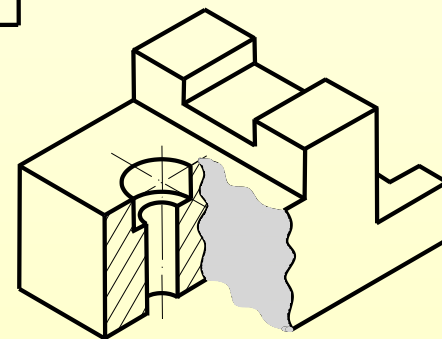

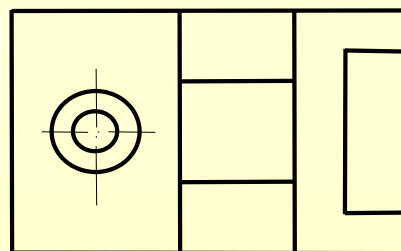

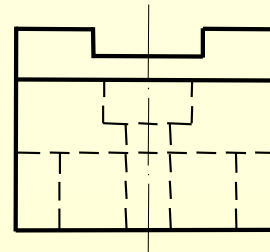

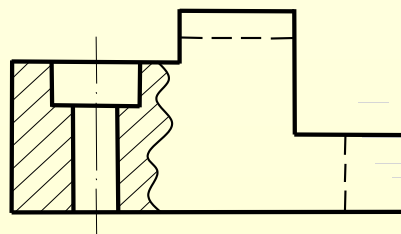

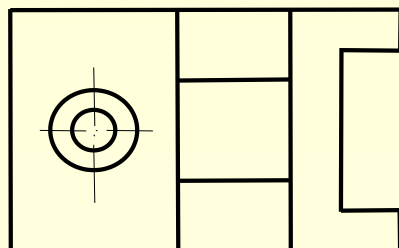

Corte Parcial

Nos cortes parciais o plano secante atinge a peça somente até aonde se deseja detalhar; e o limite do corte é definido por uma linha de ruptura.

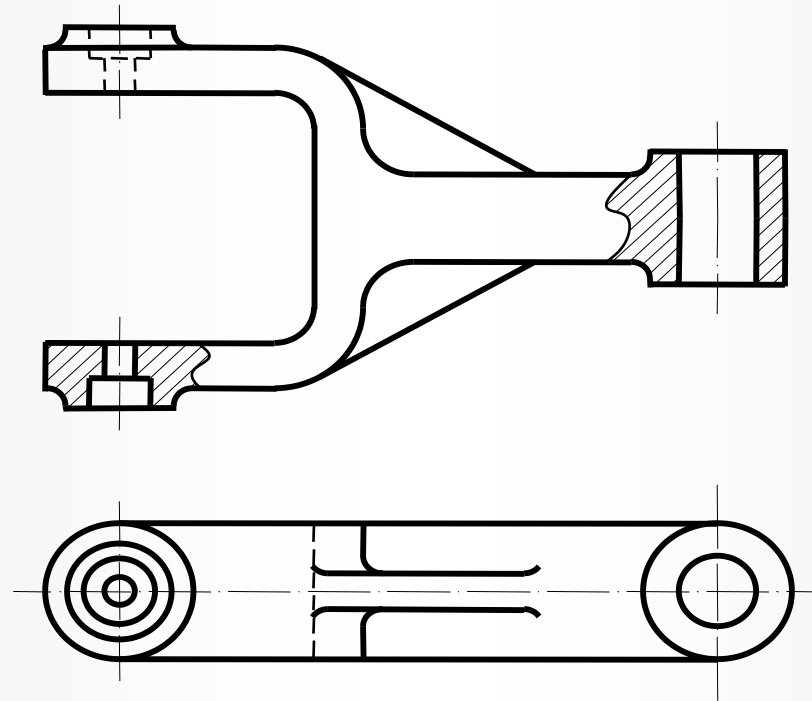

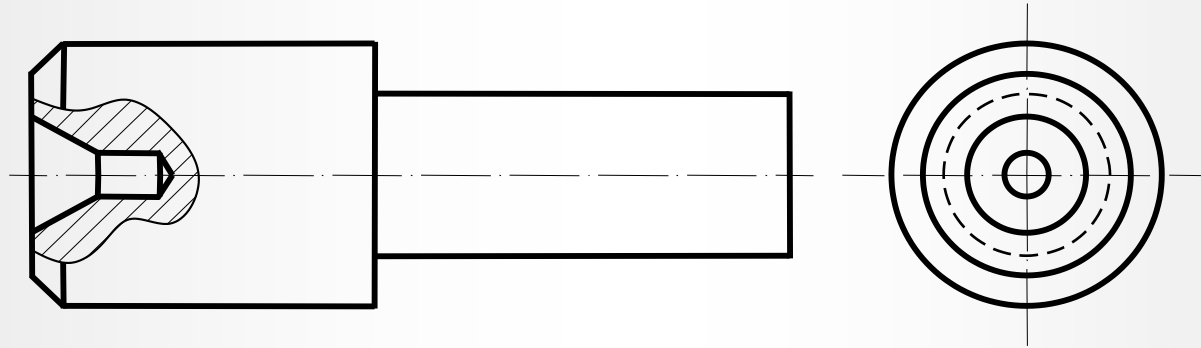

Nos cortes parciais são representadas todas as arestas invisíveis, ou seja, se colocam todas as linhas tracejadas.

**A LINHA DE RUPTURA É
UMA LINHA IRREGULAR,
CONTÍNUA
E DE ESPESSURA FINA.**

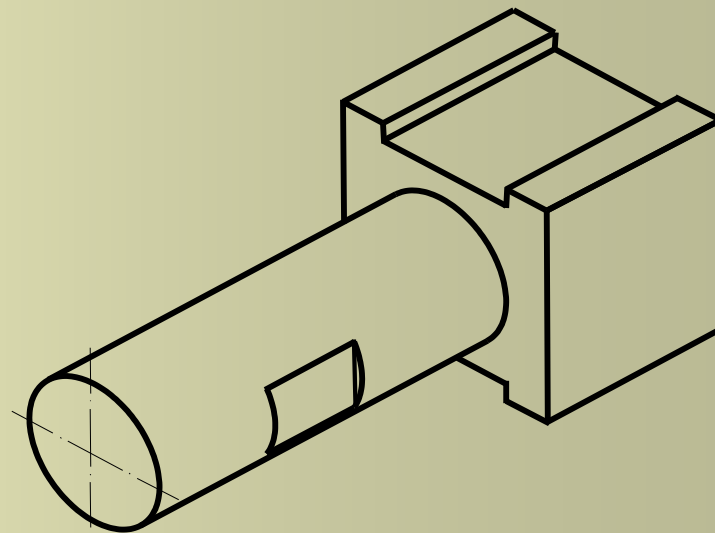

Corte Parcial – Exercícios Resolvidos

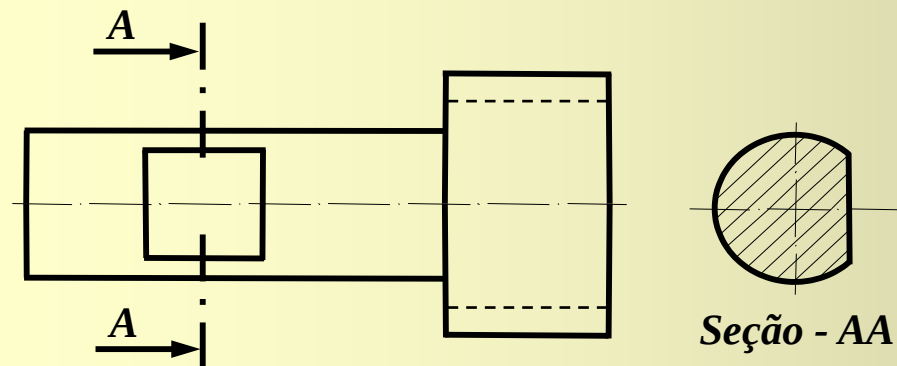

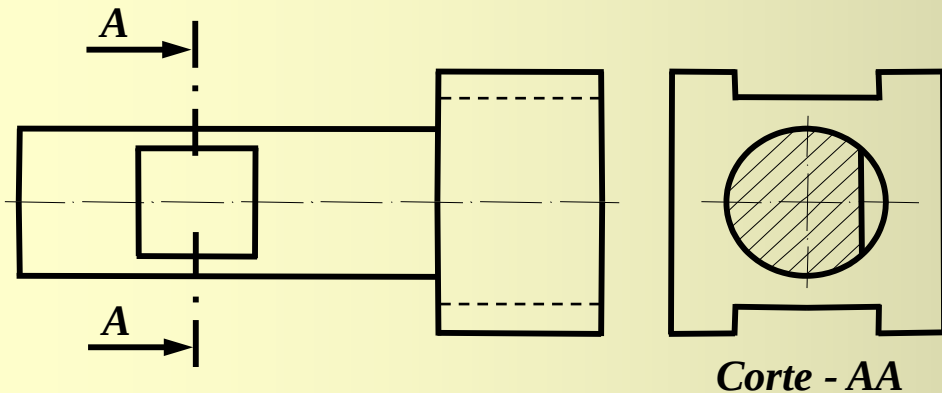

Seções

Uma seção representa a forma de um determinado ponto da peça.

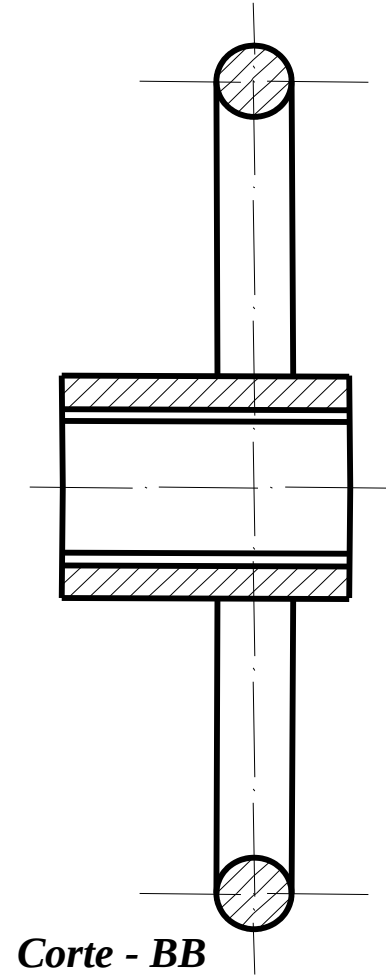

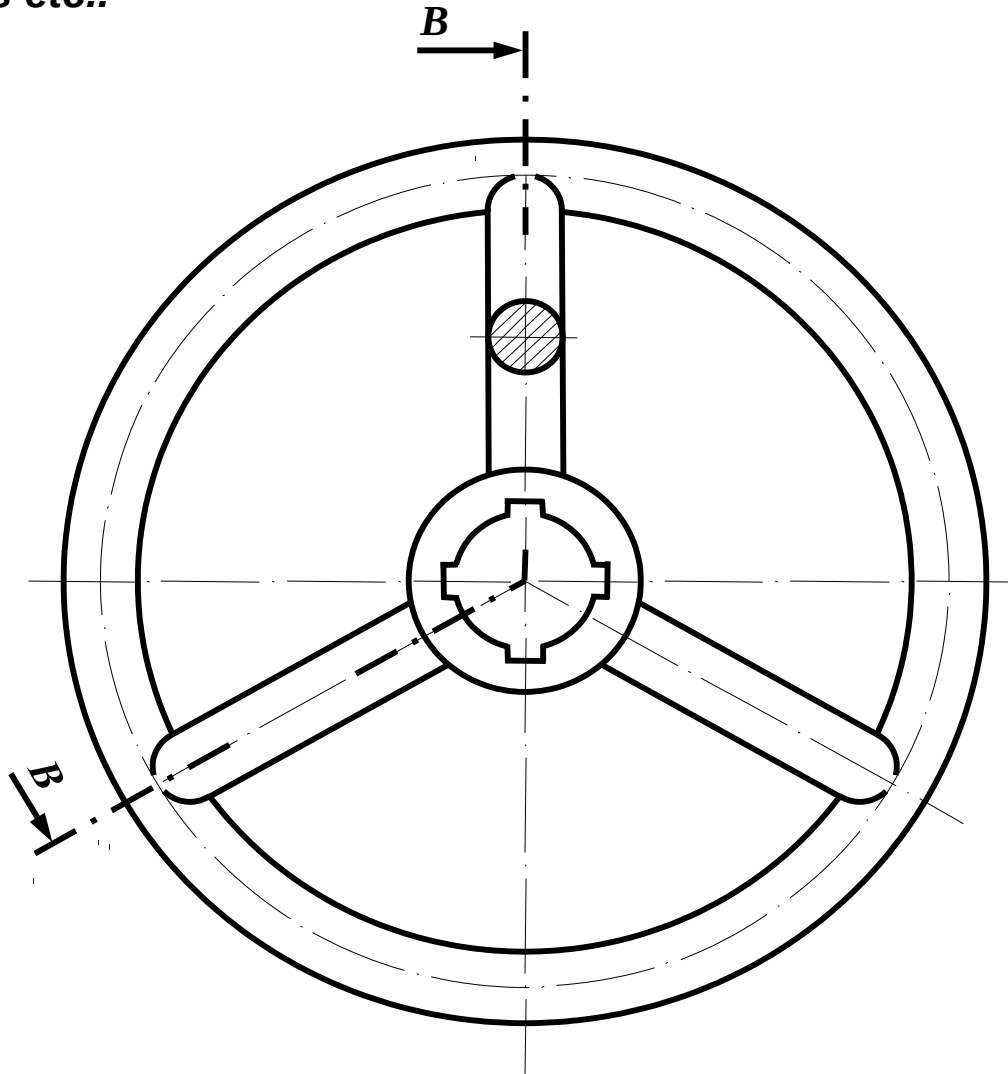

Na vista em corte é representado tudo que se está vendo a partir do plano de corte AA.

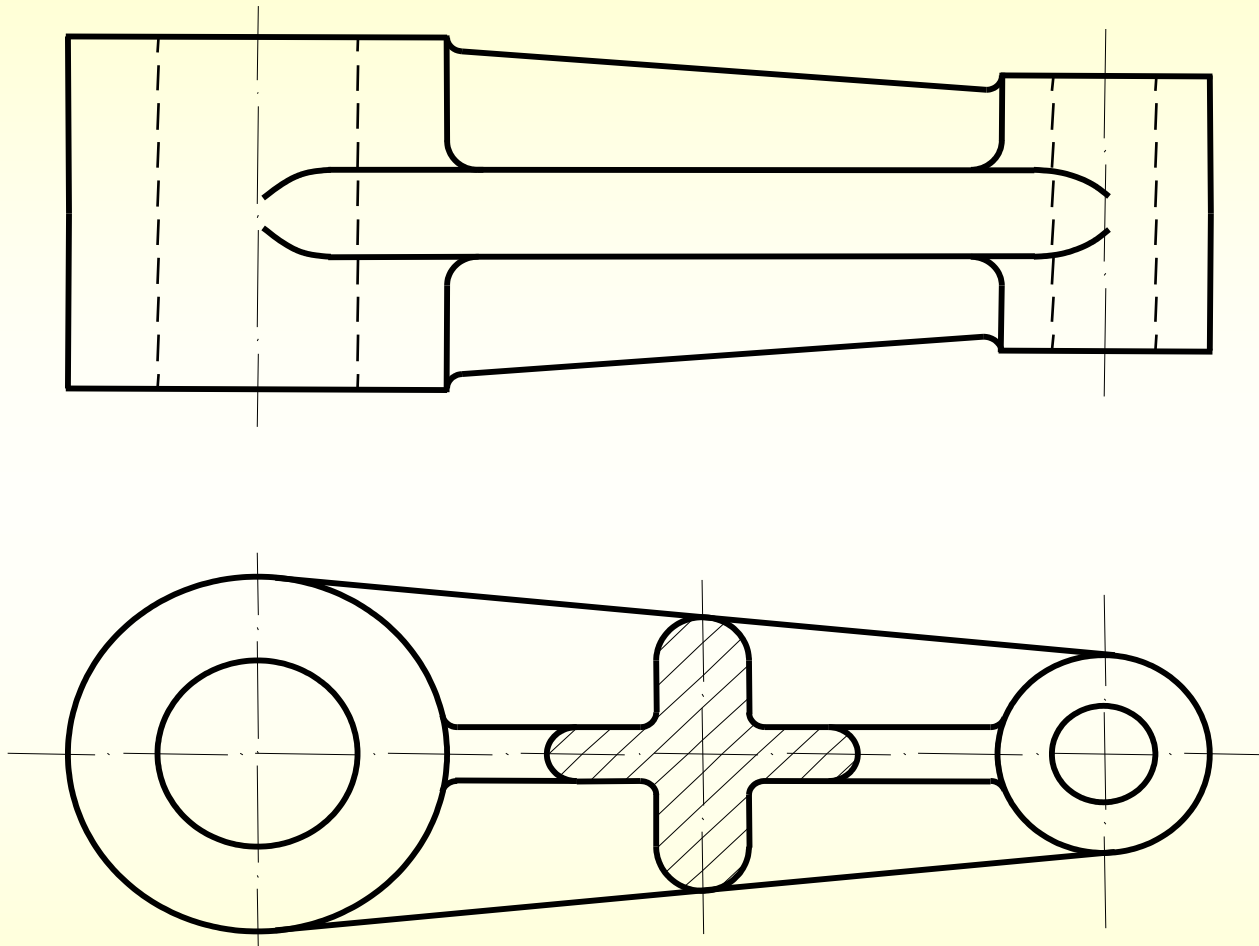

Na seção é representada somente a parte atingida pelo plano de corte AA (parte hachurada).

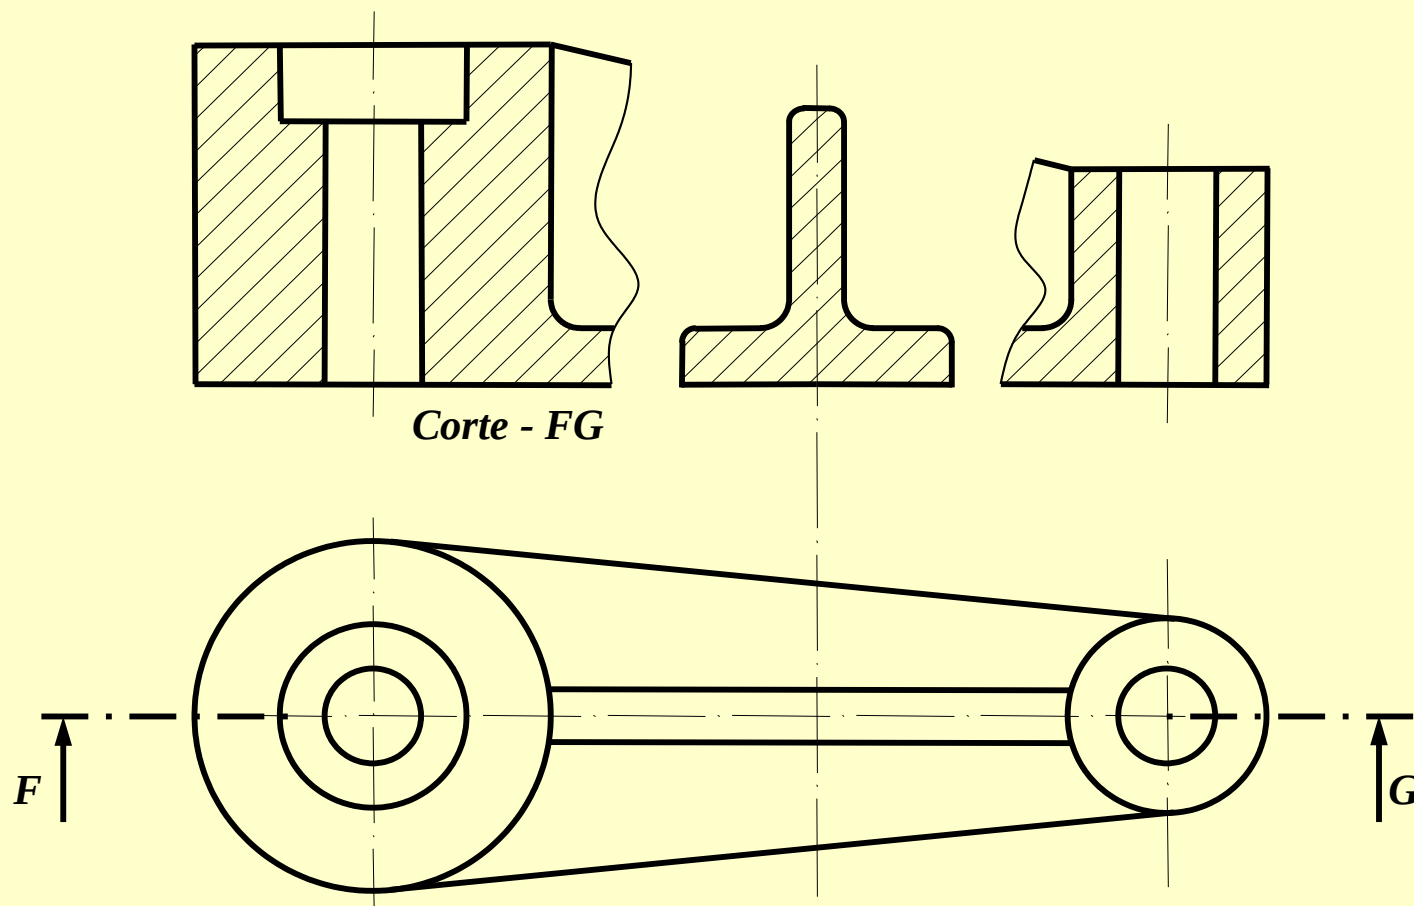

As seções podem ser desenhadas dentro do contorno da vista ou fora do contorno da vista e são utilizadas para representar a forma de nervuras, braços de volantes, rasgos etc..

Exemplo de seção desenhada dentro do contorno da vista

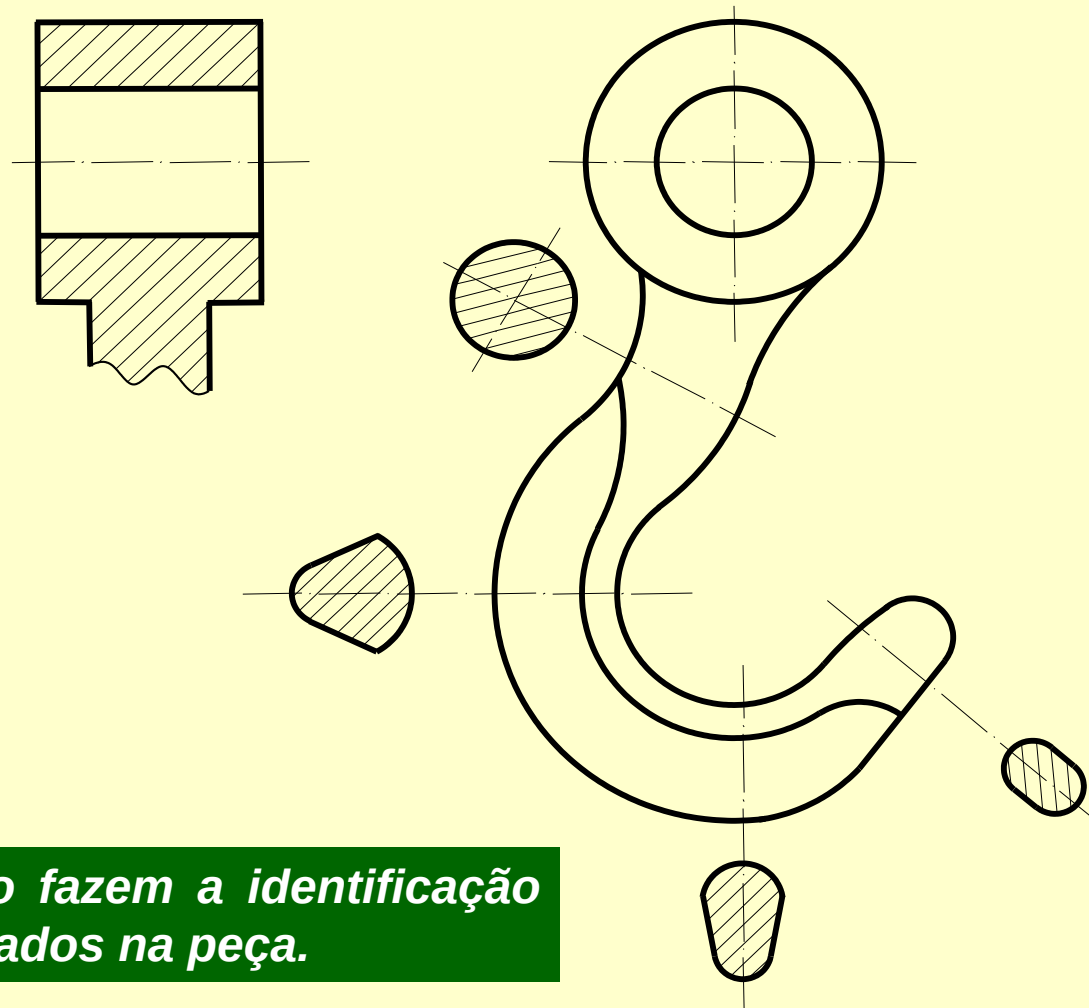

Quando as linhas do desenho prejudicarem a interpretação da seção e vice-versa, faz-se a interrupção da vista utilizando linhas de rupturas.

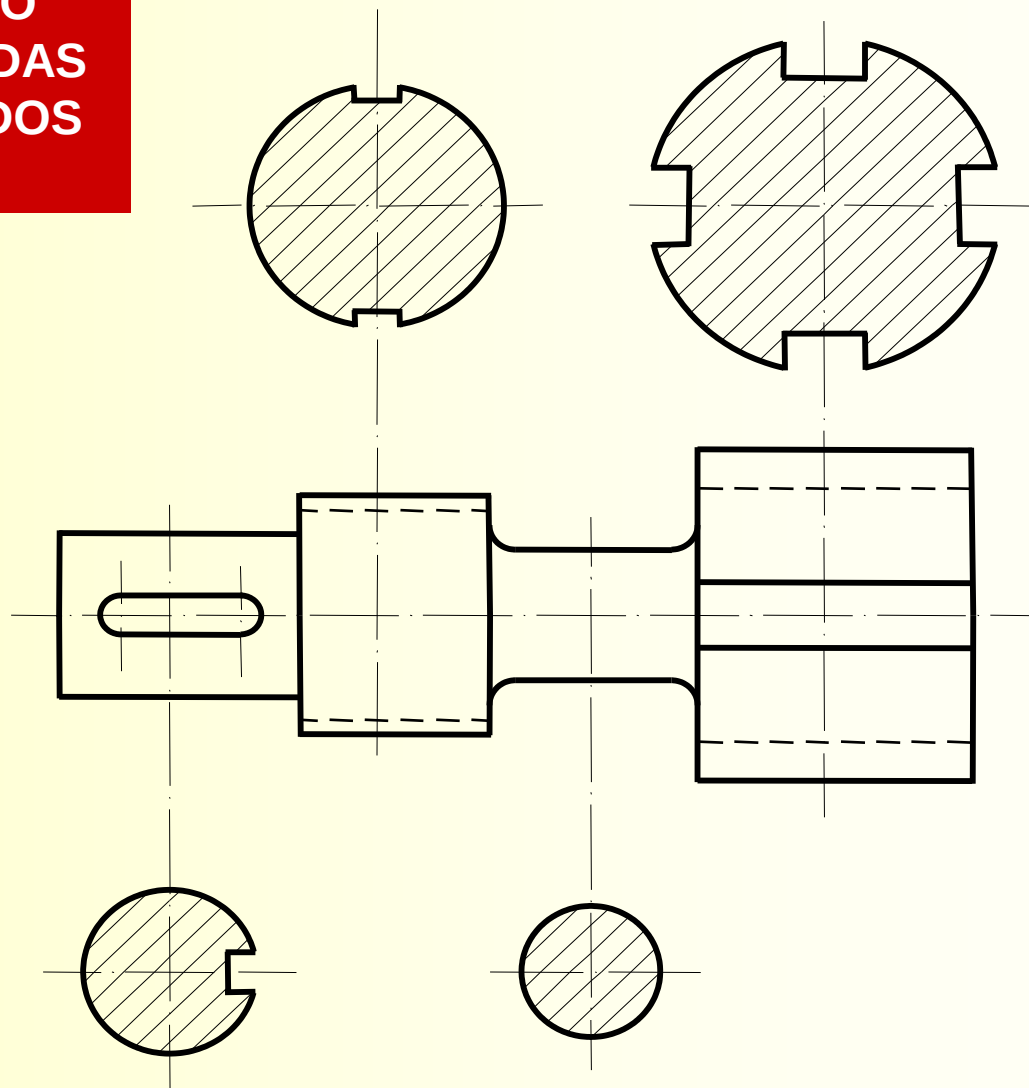

Como a peça tem dimensões variáveis ao longo de seu comprimento, uma linha de centro vincula a seção a um determinado ponto da peça.

As seções podem ser utilizadas para mostrar a variação da forma de uma peça ao longo de seu comprimento (Seções Sucessivas).

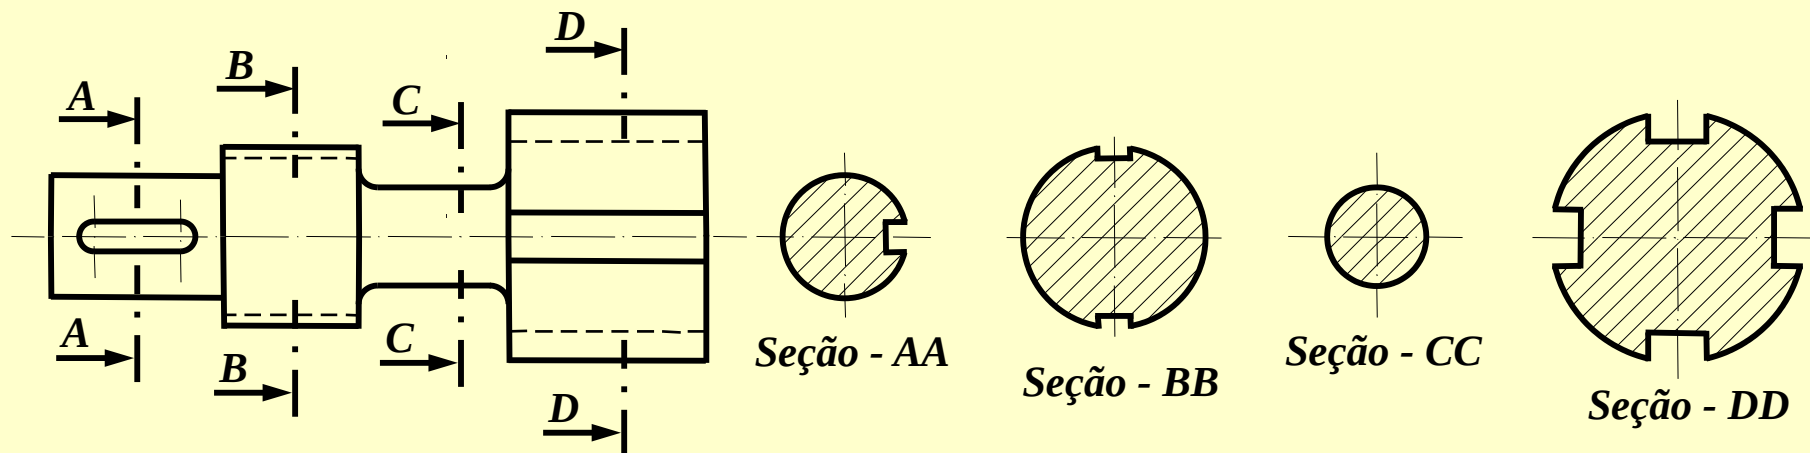

As linhas de centro fazem a identificação dos pontos seccionados na peça.

**AS LINHAS DE CENTRO
FAZEM A VINCULAÇÃO DAS
SEÇÕES A DETERMINADOS
PONTOS DA PEÇA.**

Quando as seções forem desenhadas fora do contorno da vista e deslocadas em relação à posição da vista, é necessário fazer a identificação da posição do plano secante utilizando linha de corte e letras para vinculação das seções com a peça.
